EDITORIAL POLICY
Horizonte de Enfermería Journal is a periodical publication of the School of Nursing at the Pontificia Universidad Católica de Chile, whose purpose is to contribute to the national knowledge within the scope of health and nursing.

Horizonte de Enfermería Journal publishes original articles in English and Spanish in three sections: original articles, revisions and other contributions. The opinions expressed in the article, as well as all material related to the truthfulness, adjustments, and origin of the bibliographic citations, photos, tables, graphics, quotes, are exclusive responsibility of the authors. In the case of including material from other sources, authors' consent must be included. The author, at the time of submitting the article, should point out the section in which he/she wants it published.

Review process
Our journal uses Open Journal System (OJS) for submission of the manuscript. When the editor receives the paper submitted for publication a confirmation email is send to the principal author. After the preliminary review of the editor, which verifies compliance with the checklist of disclosure requirements (Annex N°2), the article is sent to three reviewers of the Referees Committee, ensuring the anonymity of the authors in the evaluation and approval of work.

Once assessed by the Referee Committee, it is determined if the article is approve without amendments, with modifications, or rejected. The result of the classification of the article, along with suggestions, is inform to the author via email.

The review and revision process is conduct in a period of 4 months in average. Papers are required to be in Word format for submission to the OJS system. Please attach letter of publication, authorship statement (Annex N°1) and checklist of disclosure requirements (Annex N°2) in the complementary section of the submission process. These documents are available on the journal website (www.revistahorizonte.uc.cl).

Refereeing system
The approval of the article is subject to the results of the review carried out by at least two pairs. The result is report promptly to the main author through e-mail. The publication order is up to the editorial production. In case of existing conflict of interest with a pair evaluator, the opportunity to give the name of the person you do not want to participate in the refereeing process exist on the OJS system. Once the paper is accepted, the author or authors must be a subscriber to the journal for its publication. Selected works will be property of the Journal and published. Unless the author sends a written request with the decision to withdraw the article for publication.

Ethical aspects
Privacy and confidentiality
Horizonte de Enfermería Journal assumes that the privacy and confidentiality of information from research to be publish, is approve by the respective Ethics Committee. It must be clearly stated that the procedure of obtaining informed consent, ensured anonymity and confidentiality of those involved in the research. This is a requirement that must be indicated explicitly in the article.

Also the editor, the editorial board and peer reviewers maintain strict privacy regarding the information on manuscripts received, content, status in the review process, critic by reviewers or final destination. Therefore, members of the editorial staff and reviewers of the Horizonte de Enfermería Journal are committed to respect the copyright.
Conflicts of interest
Conflicts of interest exists when an author (or institution of the author), reviewer, or publisher has personal or financial relations that influence unsuitably their actions (those relations also are known as two commitments, where interests or loyalties compete). Not all the relations represent certain conflict of interest. On the other hand, the potential of conflicts of interest can exist independently if an individual thinks that the relation affects its scientific judgment. The Journal Horizonte de Enfermería requests the authors the explicit statement of the existence of potential conflicts of interest. Authors should do so in the manuscript in a notification page of conflicts of interest following the title page.
Editors reserve the right to publish information disclosed by authors about potential conflicts.
For more information visit the website: Uniform Requirements for Manuscripts Submitted to Biomedical Journals: Ethical Considerations in the Conduct and Reporting of Research: http://www.icmje.org/ethical_5privacy.html

PUBLICATION RULES
The article must meet the following requirements: Extension not to exceed twenty pages, written on letter size paper, on one side, double-spaced with a margin of three cm. on all four sides, Times New Roman # 12, numbered in the bottom right, starting with the title page. Figures, tables, graphs, included in the article, are included in the final pages of the work, each on a separate sheet, as instructed in the text. Papers must be written in Spanish or English.

GENERAL ORGANIZATION OF THE ARTICLE
1. Title and authors: The first page should include the title in Spanish and in English, which must indicate the centrality of the publication. The author should include in the first page, information necessary to allow sensitive and specific electronic retrieval of the article; the names of the authors, professional title, academic degrees, work place. It should be noted which will be the author with whom correspondence will be established, with postal address, email and phone number. The author of the work corresponds to that involved in its creation and implementation. Those who do not meet the criteria for authorship are mentioned in the acknowledgments, if applicable. In footnote the source of funding should be included, and if there is presence of conflicts of interest. All authors must complete the item of participation stated in the Declaration of Authorship.
2. Summary and Abstract: The second page must include the summary in Spanish, 250 words, with four key words, according to list of descriptors in Health Science [DECS] BIREME (http://www.bireme.br). The abstract in English, correspond to the translation of the summary and the keywords. The editor may modify the summary and the abstract, with the authors' permission. The abstract should accurately reflect the contents of the article. It should provide the context or background for the study, and should state the purpose, basic procedures (selection of study subjects, observational and analytical methods), main findings (give specific sizes, effect and its statistical significance, if possible), and the main conclusions. It should emphasize new and important aspects of the study or observations. It should emphasize new and important aspects of the study or observations. Articles on clinical trials should include in the summary the issues that the CONSORT group has identified as essential (http://www.consort-statement.org/?=1190).
3. Organization of the article: The organization of the article should be according to the type of manuscript submitted. Next, the order is made explicit by type of publication:

JOURNAL MANUSCRIPT CATEGORIES

ORIGINAL ARTICLES SECTION

Original Research
Research work with unpublished results that uses a qualitative or quantitative methodology.
a. Title and authors
b. Summary and Abstract
c. Introduction: should provide context or background for the study (nature of the problem and its importance) based on a brief review of the literature, the purpose or objective, or hypothesis tested by the study or observation. Both the primary and secondary objectives must be clear and any analysis of pre-specified subgroups described. Provide only directly relevant references and do not include data or conclusions from the work reported. Citations in text uses the latest edition of Vancouver Style, see website: http://www.nlm.nih.gov/citingmedicine.
d. Methodology: It should describe the methodology used in the investigation, stating type of study, universe and sample / subject under study, type of instruments used (reliability and validity) and data collection procedures, data analysis system, statistical methods and ethical considerations. When using known instruments or methods of data collection, point only the reference source, otherwise a brief description of these must be added. Clearly describe the selection of observational or experimental participants (including controls), including eligibility and exclusion criteria and a description of the source population. Authors should explain the use of age and sex variables when included in the study report. When using variables such as race or ethnicity, they must define how to measure these variables and justify their relevance.

Technical information: It should identify the methods, apparatus (give the name and address of manufacturer in brackets) and procedures in sufficient detail to allow others to reproduce the results. Mention references to established methods, including statistical methods, provide references and brief descriptions of methods published, but not well known, describe new or substantially modified methods, giving reasons for their use and evaluate their limitations. Identify precisely all drugs and chemicals used, including generic name (s), dose (s) and route (s) of administration.

Statistical Analysis: Describe statistical methods with enough detail to enable a knowledgeable reader with access to the original data to verify the reported results. When possible, quantify findings and present them with appropriate indicators of measurement error or uncertainty. Avoid relying solely on statistical hypothesis testing, such as P values, which fail to convey important information about effect size. Define statistical terms, abbreviations, and most symbols. Specify the computer software used.

e. Results: Present your results in logical sequence in the text. Findings are presented in tables or graphs. Avoid repeating information. Only results are presented, without including comments or discussion of them. The information in tables, figures and graphs should be submitted on separate sheets at the end of the text, each must have a title that clearly articulates the information provided and numbered in order of appearance in the text. When data is summarize in the results section, give numeric results not only as derivatives (for example, percentages) but also as the absolute number from where the derivatives were calculated. Specify the statistical methods used for analysis. Restrict tables and figures necessary to explain the argument of the paper and to assess all relevant data. Do not duplicate data in graphs and tables.

Tables: Type each table with double-spacing on a separate sheet of paper. Attach file in Excel format. Number tables consecutively in the order of their first citation in the text and supply a brief title for each. Do not use internal horizontal or vertical lines. Give each column a short or an abbreviated heading, and place explanatory matter in footnotes, not in the heading. Explain all nonstandard abbreviations in footnotes, and make sure that each table is cited in the text. When using data from another published or unpublished source, obtain permission and acknowledge the source.

f. Discussion and Conclusion: It consists in the discussion of the results in relation to other publications on the subject. It should specify the similarities and differences in their results obtained, with those of other investigations. Relate the results to the purpose of the study. Avoid unqualified statements and conclusions not adequately supported by the data. Do not repeat data presented in the results section. Point out the conclusions of the discussion. Propose recommendations when appropriate, and new hypotheses when warranted.

g. Acknowledgements: Express acknowledgement to those people or institutions who contributed to the research.

REVISION SECTION

Narrative o literature Reviews: It aims to deliver a critical analysis of published sources, or literature on a particular topic. It is an assessment of the literature and provides a summary, classification, comparison and evaluation.

a. Title and authors
b. Summary and Abstract
c. Introduction: A brief description of the subject to review, its importance, the objectives of the literature review, the purpose and organization of it in the text.
d. **Body Text:** It must develop the review of the subject as such, and identify the corresponding titles according to the organization posed in the introduction. Consider a review of current literature on each of the topics covered, avoiding delivering extensive information already published, which is solved by citing the original source. It is requested to cite primary sources of information, only in exceptional cases use secondary sources. Clarify where appropriate, the discrepancy between the sources. Citations in text must be marked according to latest edition of Vancouver Style, see website: http://www.nlm.nih.gov/citingmedicine.

e. **Conclusion:** Briefly, point out aspects to highlight of the review carried out, and generate recommendations as appropriate.

e. **Acknowledgements:** Express acknowledgement to those people or institutions who contributed to the review.

**Theoretical study:** it corresponds to the analysis of a theoretical construct in nursing science or related areas, leading to questioning existing models and the development of hypotheses for future research. It is about a theoretical, referential or conceptual framework, which gives meaning to the investigation. Based on the existing theories about the object in study, is where the new knowledge generates. In this case 15 pages are allowed.

The manuscript should present the following general structure:

a. Problem to be study
b. Explicit and implicit problems of the concepts.
c. Specified operational conceptualization.
d. Relationship between adopted theories and concepts.
e. Theoretical analysis from which the hypotheses emerge.
f. Conclude the implications of the theory with the problem.

**REVISION SECCION**

**Narrative Review or Literature:** Aims to provide current concepts about a subject with an approach from various aspects based on the synthesis of multiple studies published that leads to a general conclusion about a specific area or topic.

a. Title and authors
b. Summary and Abstract
c. Introduction: present a brief description of the subject to review, the importance of it, the objectives of the literature review, the purpose and organization of it in the text.

d. **Body of the Text:** You must develop the subject itself, and note the titles according to the organization raised in the introduction. Consider a review of current literature on each of the topics covered, avoiding extensive published information delivery, solved by quoting the source. Requested to cite primary sources, only in exceptional cases use secondary sources. Clarify where appropriate, the discrepancy between the sources. Citations in text should be marked according Style Vancouver last edition, see website: http://www.nlm.nih.gov/citingmedicine.

e. **Conclusion:** Report briefly the highlighted aspects of the review and generate recommendations when appropriate.

**Systematic Review:** are those that summarize and analyze evidence about a specific question in a structured and systematic way. The method used to find, select, analyze and synthesize the evidence is explicit. It can be: a) qualitative if descriptive evidence is present, without statistical analysis. b) Quantitative or Meta-analyzes when statistical techniques are used and the results are combine into a point estimator.

**Clinical recommendations based on evidence:**
It is short manuscripts (10 pages) based on a standardized structure to give answers to clinical questions related to patients, following the methodology of evidence-based nursing. It corresponds to systematic reviews or practical clinical guidelines.

The manuscript should present the following general structure:
a. Title or research question
b. Situation or clinical setting
c. Complete research question, including: population studied, procedure or intervention applied, the type of comparator used, results reported, time the study was conducted
d. Search: search strategies, number of studies found and inclusion criteria.
e. Critical analysis:
   a) Internal validity criteria
   b) External validity
   c) Relevance of the results, considering the research question.
f. Acknowledgements: Express gratitude to those people or institutions that contributed to its revision.

**Reflections:** Corresponds to the discussion from the professional perspective.
a. Title and authors
b. Summary and Abstract
c. Introduction: It must present a brief description of the topic to reflect, stating the most important aspects, and the aim and purpose of the reflection presented.
d. Body of reflection: It should present the development of the subject, posing the various points of view, both of disagreement and agreement of the proposed position. It is suggested that the reflection is supported in relevant literature.
e. Conclusions: Point out the most important aspects of the reflection and the contribution of the article to it.

**REFERENCES**

**Citations in text**

Citation is an acknowledgement in your text of references that support your work. All submissions must have references points according to the Vancouver style latest edition.

In the Vancouver style it is in the form of a number that correlates with a source in your reference list that goes at the end of the article. They are identified by Arabic numbers in round brackets or Arabic numbers in superscript. This applies to references in text, tables and figures.

A number must be used even if the author(s) is named in the sentence/text. e.g. Pérez (10) has argued that.... The original number assigned to the reference is reused each time the reference is cited in the text, regardless of its previous position in it.

When multiple references are cited at a given place in the text, use a hyphen to join
the first and last numbers that are inclusive. Use commas (without spaces) to separate non-inclusive numbers in a multiple citation e.g. (2,3,4,5,7,10) is abbreviated to (2-5,7,10). As a general rule, reference numbers should be placed outside full stops and commas and inside colons and semicolons. Avoid using abstracts as references. References to papers accepted but not yet published should be designated as “in press” or “forthcoming”; authors should obtain written permission to cite such papers as well as verification that they have been accepted for publication. Information from manuscripts submitted but not accepted should be cited in the text as “unpublished observations” with written permission from the source.

Reference list
It contains details only of the articles or works cited in the text of the document (Book, journal article, pamphlet, website, film or tape). This data must include sufficient detail for others to locate and review your references. It should appear at end of article listed numerically, in the same order they are cited in the text. Internet sources cited must also be in the reference list.

Units of Measurement
Measurements of length, height, weight, and volume should be reported in metric units (meter, kilogram, or liter) or their decimal multiples. Temperatures should be in degrees Celsius. Blood pressures should be in millimeters of mercury. See website: http://www.nlm.nih.gov/citingmedicine.

Abbreviations and Symbols
Use only standard abbreviations. The spelled-out abbreviation followed by the abbreviation in parenthesis should be used on first mention. Avoid abbreviations in the title of the manuscript. See website: http://www.nlm.nih.gov/citingmedicine.
